

Meeting #1

9/16/19

Today, we discussed and decided on integral aspects of our web application. We decided to focus on collecting weather data in order to create an interactive weather map of Colorado. We came to a consensus that this idea had the most practical applications, while also enabling us to utilize tools mentioned in class and outside of class. Key features include on click data from the map, weather safety information, and location specific information, including airport delays due to weather. Other specifics can be found on our milestone one document.

In terms of minor details, we also confirmed logistics regarding meeting times and forms of communication. We preferred to meet face to face, while using email as the mechanism for non face to face communication.
